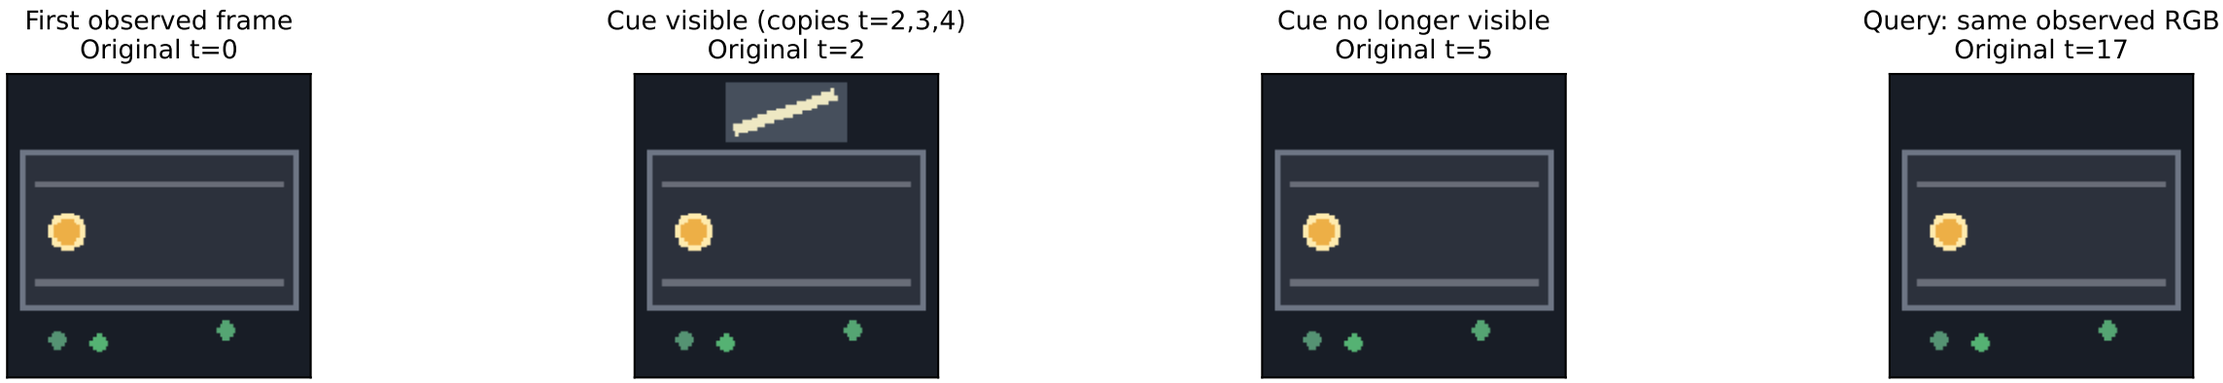
WR startup failure: observed cue is not event-protected, then all copies are evicted

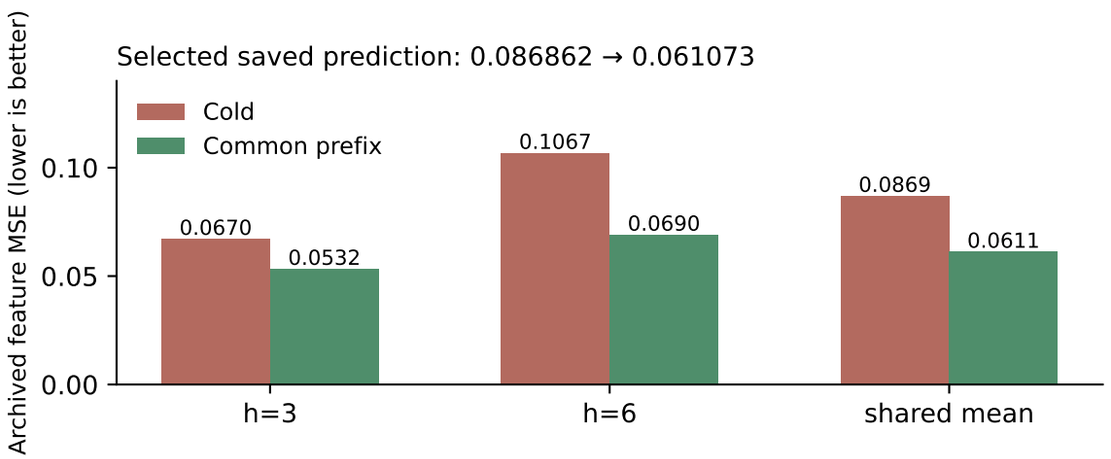
Episode 1eb3ccff25424834a0780a10 | frozen Gate reader | R=4, K=2 in both arms

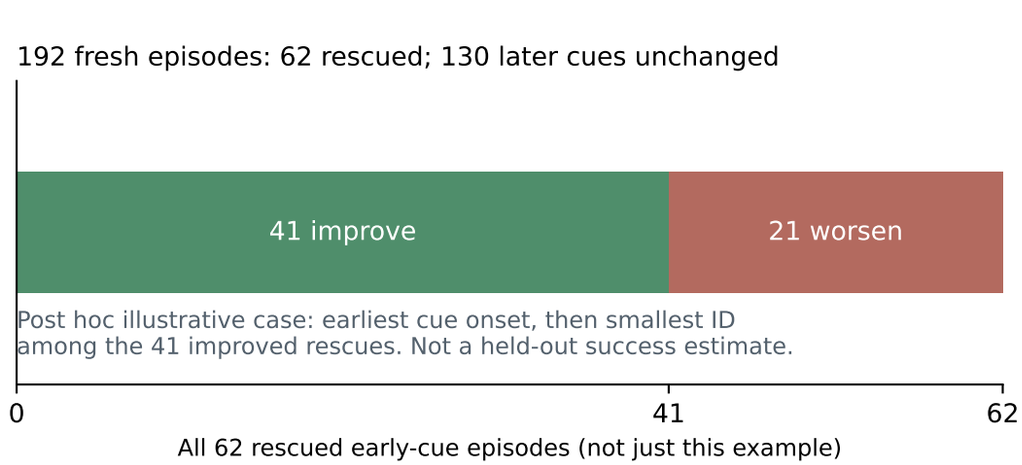


SAME onset surprise = 5789.924087; different startup state

Cold: threshold unavailable at original t=2; never event-confirmed.
Prefix: threshold = 0 at original t=2 / execution 6; confirmed one step later at original t=3 / execution 7.

Onset t=2 leaves recent at t=6, is deleted from K at t=8; equivalent t=3 and t=4 copies delay complete loss until t=10.





Exact cached RGB observations only; no predicted RGB, new model execution, or oracle animation.
Common prefix repeats the first already-observed frame four times with zero actions. It adds processing; this is not equal-total-cost superiority.
Selected-case peak logical bytes: 124,215 → 124,255 (+40). Dataset maxima: 124,431 → 124,463 (+32). Shift-only model check: 896/896 exact.
